Positive address control	Detected	Detected	Detected	Detected	Detected	Detected	Detected	Detected	Detected

All 72 marked target processes and 72 defined twins were quiet. All 18 marked positive controls were detected.
Each target process used eight fixtures; base multiplication exercised all 128 pairs per fixture.

Quiet means no marked-secret branch/address dependency observed on these paths.
This is not a statistical timing result or proof of whole-program constant time.
