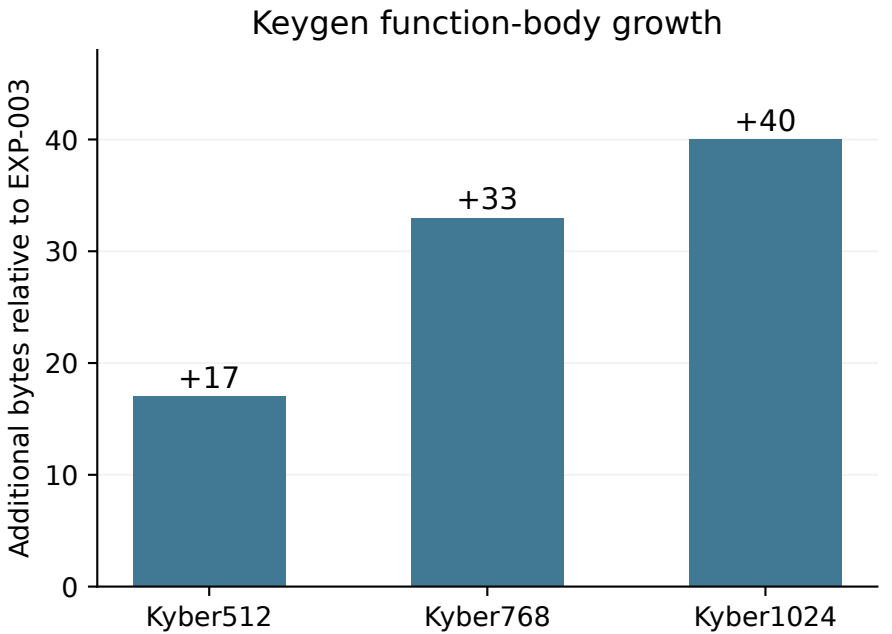
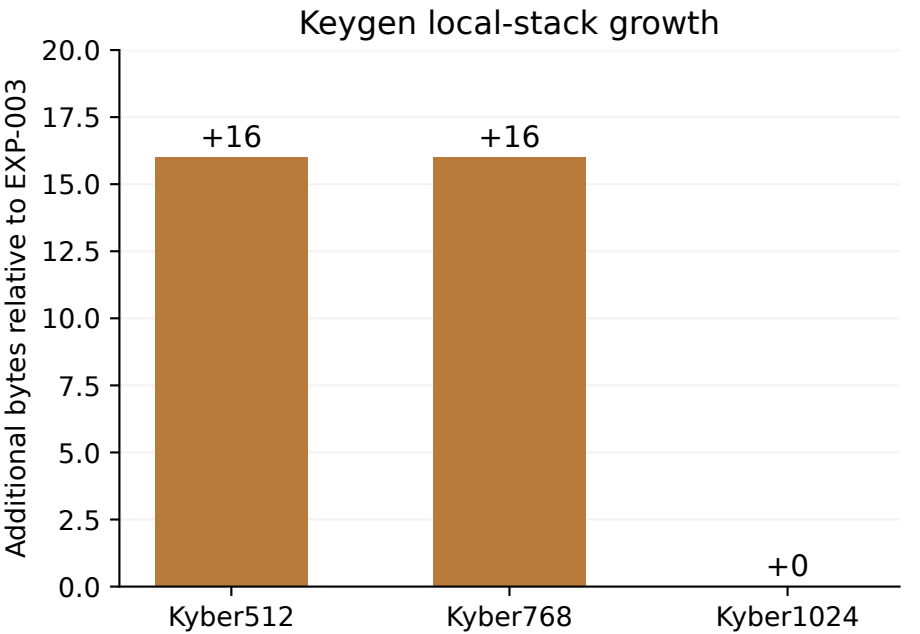
EXP-005 keygen: the measured code and local-stack tradeoff





Function bodies (EXP-003 → EXP-005): 425 → 442, 479 → 512, 948 → 988 bytes.
Local stack: 5,256 → 5,272; 9,368 → 9,384; 15,032 → 15,032 bytes.
Local stack includes saved registers; excludes entry return address and all callee frames.
Keygen canaries remain present. These are scoped observations, not total memory or a security score.
